

Certificate security-assessment 2BA Platform

In October 2020, 2BA Platform was subjected to extensive security-tests by Qbit Cyber Security on request of 2BA. The main question to be answered is whether the application is properly protected against unauthorised use. More specifically, it gives an answer to following questions:

- Can only authorised users access the application and its data?
- Can such users indeed only access data and functionality they are supposed to have access to?

Tests are carried out using state-of-the-art tools by qualified security-engineers using a “grey-box” test approach. This means Qbit had full cooperation of 2BA including access to multiple user accounts and basic information about the technical working of the application.

Qbit performed multiple series of tests in order to ensure the initially identified major findings are properly addressed. Based on the results of these tests, Qbit concludes that the level of IT security of 2BA Platform is currently average when compared to similar applications handling the same kind of data.
